

smart minibar by plastic electronic

A technical innovation by plastic electronic detects every removal from the minibar immediately and saves personnel costs at the same time!

The pressure sensor foil by plastic electronic detects the position of any object within the minibar in real-time. The system immediately alarms the responsible person when a guest removes a certain product from the minibar via SMS or E-Mail and passes the information of the taking on to the front desk for charging and internal statistics. As a matter of course, the pressure sensor foil detects the stockpiling of the minibar as well. The information of movement can also be forwarded electronically to the data processing system of the hotel via common communication technologies. Due to the pressure sensors, the system can differentiate between the product categories the product was taken from, for example Coke and Beer. Due to its flexible and slim texture, the system can be integrated into present minibars as well, which means that the existing system does not have to be replaced completely. The features mentioned lead to the following advantages of the sensor foil by plastic electronic:

- *flexible, cost-effective solutions which can be implemented into existing minibar systems*
- *labour savings due to the electrical alarming system*
- *minimal guest disturbances*
- *additional operational support tool*
